Summary Scores

OVERALL	PERFORMANCE	ACCESSIBILITY	SEO TAG INDEX
84	83	89	73

Core Web Vitals — Google PageSpeed / CrUX Telemetry

Thresholds based on Google/web.dev guidance

Largest Contentful Paint (LCP)	1.1 s [LAB] (GOOD)
Cumulative Layout Shift (CLS)	0.023 [LAB] (GOOD)
Interaction to Next Paint (INP)	Not measured (—)

Other Performance Metrics (Lab Diagnostics)

First Contentful Paint (FCP) Source: Google Lighthouse lab audit (first paint)	0.9 s [LAB] (GOOD)
Total Blocking Time (TBT) Source: Google Lighthouse lab audit	700 ms [LAB] (POOR)
Time to First Byte (TTFB) Source: Google Lighthouse lab audit (server-response-time)	1ms [LAB] (GOOD)

Resource Payload Size Breakdown

Scripts (JS)	778.7 KB (9 files)
Stylesheets (CSS)	3.4 KB (2 files)
Images	0 KB (6 files)
Fonts	38.6 KB (1 files)

Performance Score Explainability & Audit Trail

Auditing Methodology: Google Lighthouse Performance Audit

Scoring Formula: Performance Score = (Normalized LCP Score × 25%) + (Normalized TBT Score × 30%) + (Normalized CLS Score × 25%) + (Normalized FCP Score × 10%) + (Normalized Speed Index Score × 10%)

Calculated from normalized metric scores (0–100) using the configured metric weights.

Metric	Raw Value	Rating	Weight	Score	Contribution
Largest Contentful Paint	1.1 s	GOOD	25%	100	+25
Interaction to Next Paint	N/A	UNRATED	0%	—	Excluded
Cumulative Layout Shift	0.023	GOOD	25%	100	+25
Total Blocking Time	700 ms	POOR	30%	42	+12.6
First Contentful Paint	0.9 s	GOOD	10%	100	+10
Speed Index	1.0 s	GOOD	10%	100	+10
Time to First Byte	1ms	GOOD	0%	100	0

Authoritative Performance Score: 83 / 100

* TTFB Source: Measured in lab (Google Lighthouse)

* TBT Source: Measured in lab (Google Lighthouse simulated audit)

Actionable Optimization Recommendations

HIGH • PERFORMANCE

CONFIDENCE: HIGH

1. Split long JavaScript tasks to minimize Total Blocking Time

Finding: Total Blocking Time is 700ms, exceeding the 200ms recommended target. Main-thread execution delays user interaction responsiveness.

Evidence: TBT: 700ms (target: <= 200ms). Source: Google Lighthouse lab audit

Potential Impact: Relieves main-thread CPU congestion and eliminates input latency during page load.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Reduce JavaScript blocking work and break up long main-thread tasks (>50ms) using `scheduler.yield()` or `requestIdleCallback()`, and offload CPU-intensive operations to Web Workers.

MEDIUM • SEO

CONFIDENCE: HIGH

2. Provide a meta description for search engine result snippets

Finding: No `<meta name="description">` tag was found in document `<head>`

Evidence: No `<meta name="description">` element detected in document `<head>`

Potential Impact: Search engine result snippet presentation and click-through rate (CTR).

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Declare a `<meta name="description" content="...">` tag (120-160 characters) in the page `<head>` section.

MEDIUM • PERFORMANCE

CONFIDENCE: HIGH

3. Reduce JavaScript not required during initial page load

Finding: Approximately 89 KB of JavaScript was not executed during this page load.

Evidence: Approximately 89 KB of JavaScript remained unexecuted during initial page load.

Potential Impact: Reduces initial script transfer size and deferred compilation overhead on the main thread.

Estimated Savings [TRANSFER_ONLY]: TRANSFER-ONLY MODEL: Save ~0.45s transfer on Fast 3G (89 KB @ 200 KB/s) (Assumption: TRANSFER-ONLY MODEL: Fast 3G network profile (200 KB/s wire transfer rate; does NOT predict FCP/LCP/TBT improvement))

Recommended Action: Reduce JavaScript that is not required during initial page load: Defer non-critical interactive components and third-party scripts using `dynamic import()` route-based code splitting.

MEDIUM • PERFORMANCE

CONFIDENCE: HIGH

4. Implement lazy loading for below-the-fold images

Finding: 6 below-the-fold image(s) loaded synchronously without `loading="lazy"`

Evidence: 6 `img` element(s) detected without `loading="lazy"` attribute

Potential Impact: Relieves initial network contention by deferring image requests outside the viewport.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Add `loading="lazy"` attribute to all 6 images that appear below the viewport fold.

MEDIUM • SEO

CONFIDENCE: HIGH

5. Provide a canonical URL link tag

Finding: No `<link rel="canonical">` element found in document `<head>`

Evidence: No link element with `rel="canonical"` found in `<head>`

Potential Impact: Consolidates duplicate URL indexing signals and avoids search ranking fragmentation.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Declare `<link rel="canonical" href="https://example.com/authoritative-path">` in the `<head>` of every page.

6. Add a skip navigation link for keyboard users

Finding: Navigation landmark detected with 26 links before main content, but no bypass link mechanism exists

Evidence: Page features <header>/<nav> containing 26 links with no bypass anchor (WCAG 2.4.1)

Potential Impact: Allows keyboard and screen reader users to jump past repetitive navigation directly to main content.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Add an accessible skip link as the very first focusable element inside <body>, e.g. Skip to main content.
