Summary Scores

OVERALL	PERFORMANCE	ACCESSIBILITY	SEO TAG INDEX
85	86	89	73

Core Web Vitals — Google PageSpeed / CrUX Telemetry

Thresholds based on Google/web.dev guidance

Largest Contentful Paint (LCP)	1.9 s [LAB] (GOOD)
Cumulative Layout Shift (CLS)	0.023 [LAB] (GOOD)
Interaction to Next Paint (INP)	N/A [LAB] (UNRATED)

Other Performance Metrics (Lab Diagnostics)

First Contentful Paint (FCP) Source: Google Lighthouse lab audit (first paint)	1.7 s [LAB] (GOOD)
Total Blocking Time (TBT) Source: Google Lighthouse lab audit (7 long task(s), max: 169ms)	510 ms [LAB] (NEEDS-IMPROVEMENT)
Time to First Byte (TTFB) Source: Google Lighthouse audit (server-response-time, root document response)	1ms [LAB] (GOOD)

Resource Payload Size Breakdown

Scripts (JS)	779.1 KB (10 files)
Stylesheets (CSS)	3.4 KB (2 files)
Images	0 KB (6 files)
Fonts	38.6 KB (1 files)

Performance Score Explainability & Audit Trail

Auditing Methodology: Google Lighthouse Performance Audit

Scoring Formula: Performance Score = (Normalized Metric Score LCP × 0.25) + (Normalized Metric Score TBT × 0.30) + (Normalized Metric Score CLS × 0.25) + (Normalized Metric Score FCP × 0.10) + (Normalized Metric Score SI × 0.10)

Note: Individual metric values are first normalized to 0-100 scores based on Web.dev CVP thresholds before applying weights.

Metric	Raw Value	Rating	Weight	Score	Contribution
Largest Contentful Paint	1.9 s	GOOD	25%	98	+24.5
Interaction to Next Paint	N/A	UNRATED	0%	N/A	Excluded
Cumulative Layout Shift	0.023	GOOD	25%	100	+25
Total Blocking Time	510 ms	NEEDS-IMPROVEMENT	30%	57	+17.1
First Contentful Paint	1.7 s	GOOD	10%	92	+9.2
Speed Index	1.7 s	GOOD	10%	100	+10
Time to First Byte	1ms	GOOD	0%	100	0

Authoritative Performance Score: 86 / 100

* TTFB Evidence: Measured via Google Lighthouse 'server-response-time' audit (root document response = 1ms)

* TBT Evidence: Measured via Google Lighthouse simulated 4x CPU throttling (510 ms; 7 long task(s) captured)

Actionable Optimization Recommendations

MEDIUM • PERFORMANCE

CONFIDENCE: HIGH

1. Split long JavaScript tasks to minimize Total Blocking Time

Finding: Total Blocking Time of 510ms exceeds the 200ms recommended threshold (across 7 long task(s) (longest: 169ms, 530ms blocking)) | Script: https://www.gstatic.com/recaptcha/releases/BnqMGSY_YP4cCmbNINHpJPkd/recaptcha__en.js | Work breakdown: Script Evaluation (1044ms), Script Parsing & Compilation (314ms)

Evidence: long-task: https://www.gstatic.com/recaptcha/releases/BnqMGSY_YP4cCmbNINHpJPkd/recaptcha__en.js [169ms] | long-task: https://www.gstatic.com/recaptcha/releases/BnqMGSY_YP4cCmbNINHpJPkd/recaptcha__en.js [166ms] | long-task: https://www.gstatic.com/recaptcha/releases/BnqMGSY_YP4cCmbNINHpJPkd/recaptcha__en.js [166ms]

Potential Impact: Relieves main-thread CPU congestion and eliminates input latency during page load.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Break up long tasks (>50ms) using `scheduler.yield()` or `requestIdleCallback()`, defer non-critical JavaScript execution, and offload CPU-intensive work to Web Workers.

MEDIUM • SEO

CONFIDENCE: HIGH

2. Provide a meta description for search engine result snippets

Finding: No `<meta name="description">` tag was found in document `<head>`

Evidence: missing-meta-tag: `meta[name="description"]`

Potential Impact: Search engine result snippet presentation and click-through rate (CTR).

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Declare a `<meta name="description" content="...">` tag (120-160 characters) in the page `<head>` section.

MEDIUM • PERFORMANCE

CONFIDENCE: HIGH

3. Investigate unused code / code splitting for JavaScript scripts

Finding: 89 KB of unexecuted JavaScript code observed at runtime via Chrome DevTools Protocol Coverage (investigate unused code / code splitting)

Evidence: cdp-coverage-unused-js: [https://www.google.com/xjs/_js/k=xjs.hd.en_GB.IHIZJVG-...\[=121509378\]](https://www.google.com/xjs/_js/k=xjs.hd.en_GB.IHIZJVG-...[=121509378]) [389KB] | cdp-coverage-unused-js: [https://www.gstatic.com/og/_js/k=og.asy.en_US.EfyutnwR...\[LRVMB5CJzA\]](https://www.gstatic.com/og/_js/k=og.asy.en_US.EfyutnwR...[LRVMB5CJzA]) [88.5KB] | cdp-coverage-unused-js: [https://www.gstatic.com/og/_js/k=og.asy.en_US.EfyutnwR...\[LRVMB5CJzA\]](https://www.gstatic.com/og/_js/k=og.asy.en_US.EfyutnwR...[LRVMB5CJzA])

Potential Impact: Reduces initial script transfer size and deferred compilation overhead on the main thread.

Estimated Savings [TRANSFER_ONLY]: TRANSFER-ONLY MODEL: Save ~0.45s transfer on Fast 3G (89 KB @ 200 KB/s) (Assumption: TRANSFER-ONLY MODEL: Fast 3G network profile (200 KB/s wire transfer rate; does NOT predict FCP/LCP/TBT improvement))

Recommended Action: Investigate unused code / code splitting: CDP runtime coverage observes unexecuted code during initial load, not dead code. Defer non-critical interactive code using `dynamic import()` route-based code splitting. Do not assume tree-shaking is applicable unless build-time static analysis confirms unreferenced exports.

MEDIUM • PERFORMANCE

CONFIDENCE: HIGH

4. Implement lazy loading for below-the-fold images

Finding: 6 below-the-fold image(s) loaded synchronously without `loading="lazy"`

Evidence: missing-lazy-load: `img.uHGFVd.AZNDm` | missing-lazy-load: `img.uHGFVd.EOLKOc` | missing-lazy-load: `img.uHGFVd.EOLKOc`

Potential Impact: Relieves initial network contention by deferring image requests outside the viewport.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Add `loading="lazy"` attribute to all 6 images that appear below the viewport fold.

5. Provide a canonical URL link tag

Finding: No <link rel="canonical"> element found in document <head>

Evidence: missing-link-tag: link[rel="canonical"]

Potential Impact: Consolidates duplicate URL indexing signals and avoids search ranking fragmentation.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Declare <link rel="canonical" href="https://example.com/authoritative-path"> in the <head> of every page.

6. Add a skip navigation link for keyboard users

Finding: Navigation landmark detected with 26 links before main content, but no bypass link mechanism exists

Evidence: wcag-bypass-blocks: body > a.skip-link

Potential Impact: Allows keyboard and screen reader users to jump past repetitive navigation directly to main content.

Estimated Savings [NOT_QUANTIFIED]: Not quantified

Recommended Action: Add an accessible skip link as the very first focusable element inside <body>, e.g. Skip to main content.
